# Training Integral Security / Information Security

## Products / Service description

To obtain information and data on highly developed technologies and patents, on customers and employees, but also on well-rehearsed processes or similar, new variations of criminal activities are constantly being developed. The motive lies either in financial loot or in weakening a company as a competitor. Employees at all hierarchical levels with their diverse social contacts in business and private life offer a wide scope for attack, all the more so as companies are focusing heavily on securing their IT systems against cyber-attacks. The exploited vulnerability, the user himself, is increasingly coming into the focus of attackers. The human being with his behavior is thus the greatest risk for a company - on the one hand in information security, but also in the creation of integral security.

| | |
|---|---|
| BENEFITS | Significant improvement in risk awareness and the application of defensive measures in the areas of information and IT security, but also physical and personal security. Significant reduction of vulnerability to attacks and a substantial increase in security maturity throughout the company. |
