

Preliminary analysis of circumstantial evidence of eavesdropping Identification of hidden listening devices and cameras

The preliminary analysis for eavesdropping defense / TSCM (Technical Surveillance Counter Measures) is the first step to secure the confidentiality and privacy of your premises. It enables to identify potential eavesdropping or security risks and, if necessary, to initiate comprehensive eavesdropping / sweeping measures. It helps to assess potential risks associated with eavesdropping and spying techniques and installations by third parties.

BENEFITS	Identifying indicators and signs of potentially hidden audio and video devices provides the basis to assess whether an in-depth technical investigation (TCSM / sweeping) is warranted. It enables the detection and removal of unauthorized recording devices to ensure that privacy and security is maintained.
CONTENTS	<ul style="list-style-type: none"> ▪ Two experts inspect your premises on site to detect any signs of wiretapping or suspicious activity. ▪ Creation of thermal images for the purpose of identifying electrical devices due to heat development. ▪ Measurements using lens finder to identify installed cameras and lenses. ▪ Brief documentation of findings and recommendations on further action.
